

PROSPECTIVE CLIENT PILOT

# Conference Ops Organizer Trial Guide

---

Run a realistic conference-program workflow from event setup through CFP, review, speaker readiness, scheduling, and public agenda publication.

## START HERE

<https://conference-ops-pilot-app.techfren.workers.dev>

Your first organizer workspace is isolated from other pilot accounts. No sample data is required.

## Trial window

Plan for a 30-day evaluation. The pilot is for hands-on product validation, not a production event launch. Use representative test data and avoid sensitive personal information.

# Before you start

One organizer can complete the full test. Add colleagues when you are ready to exercise review and speaker handoffs.

| You need                       | What to expect                                                                            |
|--------------------------------|-------------------------------------------------------------------------------------------|
| <b>A working email address</b> | Sign-up, verification, password reset, invitations, and calendar emails use this address. |
| <b>A test event concept</b>    | Name, timezone, dates, venue, CFP close date, and 2-3 topic categories are enough.        |
| <b>One reviewer email</b>      | Invite a colleague or use another address you control to test committee review.           |
| <b>One applicant email</b>     | Use a separate browser profile or address to experience the public submission flow.       |

## Account and data model

- Create your own organizer account from the pilot sign-in screen, then verify it from your inbox.
- Each prospective client receives a separate organization and event workspace.
- One person may have more than one event role. Use the role selector when testing organizer, reviewer, or speaker views.
- The pilot stores files privately. Only published program information and opted-in speaker profiles appear publicly.
- Use test data. The 30-day pilot may be reset or archived after the evaluation window.

### If email does not arrive

Check spam first. Then reply to the person who invited you to the pilot with the address you used and the approximate time of your request.

# 1. Create your event workspace

Start from a clean event. The product creates useful defaults so you can immediately configure the workflow.

- 01** Open the pilot URL, choose Create account, verify your email, and sign in.
- 02** Choose Create event. Enter the name, timezone, start and end dates, venue, and public slug.
- 03** Review the created defaults: a draft CFP, a General category and review group, an active review round, a Main room and track, and starter speaker tasks.
- 04** Open Control Room. Its Organizer trial runway links directly to the next incomplete workflow.

## Slug tip

Use a short, durable public slug such as summit-2027. Public submission and agenda links are scoped to this value.

## Suggested event setup

| Field      | Pilot example                                                   |
|------------|-----------------------------------------------------------------|
| Event      | Prospect Product Summit 2027                                    |
| Timezone   | Your venue's local timezone                                     |
| Dates      | One or two test days, at least one hour long                    |
| CFP close  | Several days in the future so draft and submit remain available |
| Categories | General plus 1-2 real themes your committee would use           |

## 2. Follow the organizer trial runway

Control Room is the home base. It shows operational exceptions and a nine-step path through the complete program lifecycle.

Desktop organizer view. Every runway action remains scoped to the current event.

### Mobile ready

The same organizer workflow is responsive at 375 px. Dialog focus, keyboard use, and event-scoped deep links were verified before handoff.

## 3. Configure and publish the CFP

Build a form that reflects the questions your team genuinely needs, then prove the applicant experience from the public link.

- 01** Open Form Builder. Edit the welcome copy, proposal instructions, participant instructions, and confirmation message.
- 02** Keep the required title, summary, category, and format fields. Add at least one custom question and one conditional show/hide rule.
- 03** Set the deadline, participant minimum/maximum, character budget, draft policy, and confirmation behavior.
- 04** Preview the form. Then publish it and copy the event-scoped submission link.
- 05** In a separate browser profile, save a draft, resume it, add multiple speakers if useful, and submit.

### Recommended validation scenario

- Category: General and one specialist category, each routed to the matching reviewer group.
- Conditional field: show Workshop requirements only when Format equals Workshop.
- Custom field: Repository or reference URL, optional, with URL validation.
- Participant policy: require at least one speaker and use two speakers to test co-speaker ownership.

#### Version behavior

A saved applicant draft stays pinned to the form version it started with. You can publish a later form version without silently changing an applicant's in-progress answers.

## 4. Review, decide, and activate speakers

Invite a reviewer, complete the configured rubric, stage the decision, and verify that accepted speakers receive onboarding work.

- 01** From Control Room, choose Invite reviewer. The invite grants the reviewer role and backfills eligible proposals already in the active round.
- 02** As the reviewer, open Review Desk, score every configured criterion, save a partial draft, then submit the review.
- 03** As the organizer, move the proposal from Pending or Under review to Accept queue or Decline queue. Save the staged status.
- 04** Finalize Accepted or Declined. Final states are locked to protect decision evidence and prevent duplicate onboarding effects.
- 05** Open Speaker Ops. Confirm the accepted speaker has an event-scoped profile and proposal-targeted onboarding tasks.

### Decision email

Acceptance communication is a deliberate organizer action. Use Publish communications to send the templated message after reviewing the recipient count and content.

### Review integrity built into the pilot

- Reviewers cannot review proposals they own or proposals tied to a verified claimed co-speaker account.
- Withdrawn proposals disappear from the active reviewer queue while organizer history remains available.
- Submitted reviews become read-only, and decisions remain organizer-owned.
- Applicant and speaker API views do not expose internal scores or committee routing.

# 5. Complete speaker readiness

Use the portal as the speaker, then use Speaker Ops as the organizer to verify what is still missing.

- 01 Open the acceptance or claim link using the accepted speaker's verified email address.
- 02 In Speaker Portal, complete the bio, company, title, city, pronouns, and headshot. The profile completeness meter should reach 100%.
- 03 Complete the proposal-specific slide or supporting-document task. Replace and download the uploaded artifact to prove the full lifecycle.
- 04 Return to Speaker Ops. Use its speaker/task deep link, reload, and confirm the same speaker and task remain selected.
- 05 Send an overdue-task reminder only to the reviewed recipient set. Waived and completed tasks are terminal, not actionable.

## Direct sessions

Keynotes, sponsors, breaks, and networking sessions may bypass CFP review. Content sessions require an attached speaker so the profile and readiness workflow is not stranded.

## Files accepted by the pilot

| Purpose             | Typical formats | Visibility                                                    |
|---------------------|-----------------|---------------------------------------------------------------|
| Headshot            | JPEG, PNG, WebP | Public only when the profile and linked session are published |
| Slides              | PPT, PPTX, PDF  | Private organizer/speaker access                              |
| Supporting document | DOC, DOCX, PDF  | Private organizer/speaker access                              |

## 6. Build and publish the program

Convert accepted proposals into sessions, model the venue, resolve conflicts, and publish the event-scoped public agenda.

- 01** Convert the accepted proposal into a session. Add one direct guaranteed or sponsor session if that reflects your real program.
- 02** Open Rooms and tracks. Add or rename rooms, set capacities, and assign track colors. In-use resources cannot be deleted accidentally.
- 03** Place sessions across the full event day. Conflict detection covers overlapping room, track, and speaker assignments.
- 04** Resolve the conflict, or record an explicit organizer override with an audit reason.
- 05** Open Publish. Review readiness counts, publish newly scheduled sessions, and open the canonical event-scoped agenda.

### Publication behavior

Newly scheduled sessions wait for Publish. Moving a session that is already live updates its public placement immediately and increments the calendar sequence.

### Public output to verify

- Responsive agenda with day, room, track, search, and event-scoped favorites.
- Speaker gallery containing only published speakers attached to published sessions.
- Embeddable agenda route that is cross-origin frameable while normal application routes remain protected.
- Public resource links when they have been explicitly published.
- CSV speaker/session exports and program JSON containing only accepted/published program data.

## 7. Communications, calendar, and exports

Use recipient previews and exports as safety checks before any external communication.

| Action                     | Pilot behavior                                                | What to verify                                                           |
|----------------------------|---------------------------------------------------------------|--------------------------------------------------------------------------|
| <b>Account email</b>       | Verification, reset, and invitation email                     | Delivery, link destination, and correct event role                       |
| <b>Acceptance/reminder</b> | Durable outbox and retryable queue job                        | Recipient count, template, and no duplicates                             |
| <b>Calendar</b>            | RFC 5545 REQUEST invite with stable UID and revision sequence | Gmail, Outlook, or Apple Calendar display                                |
| <b>Exports</b>             | Protected speakers.csv, sessions.csv, and program.json        | No drafts, rejected applicants, withdrawn proposals, or raw storage keys |

### Trial boundaries

- Airtable is not part of this pilot. Cloudflare D1 is the authoritative relational database.
- Acelevents automation is disabled. Its API requires eligible customer plan access and a validated write contract; use the safe CSV/JSON exports instead.
- Cloudflare email sending must be configured with a verified sender before client account testing begins.
- The realtime service is deployed for health and future fanout, while organizer dashboards use a reliable 25-second visible-tab refresh today.
- Payment, multilingual workflows, CRM/marketing automation, and general-purpose CMS features are intentionally outside this program-operations pilot.

### Privacy check

Public APIs and pages use explicit allowlists. Speaker email, phone, account identifiers, private attachments, and raw object keys must never appear in the public payload.

# A practical 45-minute test

Use this script for an efficient first session, then spend the rest of the trial on your own real operating patterns.

| Time      | Exercise                       | Evidence to capture                                          |
|-----------|--------------------------------|--------------------------------------------------------------|
| 0-5 min   | Create account and fresh event | Verification delivery; correct dates/timezone/defaults       |
| 5-15 min  | Configure and publish CFP      | Custom copy, validation, conditional field, category routing |
| 15-22 min | Submit as applicant            | Draft resume, multi-speaker data, confirmation               |
| 22-28 min | Review and decide              | Configured rubric, queue transition, locked final decision   |
| 28-34 min | Complete speaker readiness     | Profile meter, headshot, task artifact, organizer visibility |
| 34-41 min | Schedule and publish           | Rooms/tracks, conflict resolution, public agenda/gallery     |
| 41-45 min | Send/export and debrief        | Recipient preview, ICS, CSV/JSON, top friction points        |

## Send useful feedback

- What task were you trying to complete?
- What did you expect to happen, and what happened instead?
- Which event, role, and screen were you using?
- Include a screenshot and approximate time, but never include passwords or verification links.

### Need help?

Reply to the person who invited you to the pilot. Include your account email, event name, role, and a short description of the issue.

### RETURN TO THE PILOT
